
Assignment 0: ulja2020

Repository: Assignment-0, and it is public

Delivered: 03.09.2026 20:03, a day early

README: your name and student number are there. That is what I ask for

100/100 + 5 bonus = 105 A

Task 0: (requirement)

Your repository is public. The assignment asks for a private one shared with me. No points are attached, switch the setting anyway.

Task 1: (10/10 pts)

ok

Task 2: (50/50 pts)

In tools.py (15/15 pt)

ok. Suggestions: for `i in range(len(list_of_lists))` then `list_of_lists[i]` can be for `sublist in list_of_lists`, with `enumerate()` when you need the number. And `type(x)` is `int` or `type(x)` is `float` is `isinstance(x, (int, float))`.

In code.py (15/15 pt)

ok

In test_code.py (15/15 pt)

ok

In jupyterther_code.ipynb (5/5 pt)

ok

Task 3: (40/40 pts)

Folder and structure (10/10 pts)

ok

In tools.py (10/10 pts)

ok

In code.py (10/10 pts)

ok

In test_code.py (10/10 pts)

ok

Bonus: (+5)

- submit 1 day earlier: +5 (last commit 03.09 20:03)
- pylint 10/10: 0 (you are at 5.95 and 7.23)
- test with pytest: 0 (your asserts sit at module level, pytest collects nothing)
- use classes: 0
- numpy to generate the data: 0

If you are not using them already: pylint, pycodestyle and pydocstyle. Run them on your own files and fix what they report.

Overall

Full marks on the assignment and delivered a day early. Everything runs, the four power levels are spelled out in the docstring before the code that implements them, and the tests check each of the four combinations.

Fifteen of the twenty bonus points are within reach without learning anything new. Your pylint is 5.95 and 7.23, and almost all of it is line length and the `range(len())` habit above. Wrapping the asserts in `test_something()` functions is another 5, and numpy generating the temperature list instead of typing it out is a third.

Printing the subtotal of each list next to the grand total was your own addition, and it makes the output far easier to check by eye.

One thing to do today: make the repository private.
